### **The Satellites and Their Orbits**

- Satellite is an artificial object which has been intentionally placed into orbit.
- Orbit is a gravitationally curved trajectory of an object around a point in space.
- The orbit that is chosen for a satellite depends upon its application.
- Satellite's orbit works because of a balance between 2 forces.
- Orbit is a combination of the satellite's velocity.

**Satellite orbits**

## **Precession of Earth**

Precession is caused by the gravitational pull of the Sun and the Moon on the Earth.

- Period of precession is about 26,000 years.
- Caused by the gravitational pull of the Sun and the Moon on the Earth.

## Precession of Orbit

It is known as axial precession. It is the movement of the rotational axis of an astronomical body, whereby the axis slowly traces out a cone. For Earth, this is also known as the precession of the equinoxes, lunisolar precession, or precession of the equator.

- Nodal precession
- Sun synchronous
