### CBSE Class 11-Physics: Kinematics Problems: Questions and Answers-Part 2 (For CBSE, ICSE, IAS, NET, NRA 2022)

Glide to success with Doorsteptutor material for CBSE/Class-7 : [get questions, notes, tests, video lectures and more](#)- for all subjects of CBSE/Class-7.

#### Question 1:

A particle moves in a straight line according to the relation  $x = t^3 - 4t^2 + 3t$

Find the acceleration of the particle at displacement equal to zero.

#### Solution

We need to make use of differential calculus in such question. So, acceleration can be finding out like this

$$\frac{dx}{dt} = 3t^2 - 8t + 3$$

$$\frac{d^2x}{dt^2} = 6t - 8$$

So, it is clear, we can find acceleration if we know the value of  $t$ .

Now we need to find the value of  $t$  where  $x = 0$ .

So

$$t^3 - 4t^2 + 3t = 0$$

$$t(t - 1)(t - 3) = 0$$

so,  $t = 0, 1, 3$

So, displacement becomes zero at these value of  $t$

Now acceleration can be finding out by the using the above derived equation

So, at  $t = 0, a = 8$  ;  $t = 1, a = -2$  ;  $t = 3, a = 10$

#### Question:

Which of the following remain constant during the motion of a projectile fired from a planet?

- A) Kinetic energy
- B) Momentum

C) Vertical component of velocity

D) Horizontal component of velocity

**Solution (d)**

$$KE = \left(\frac{1}{2}\right) mv^2$$

Momentum =  $mv$

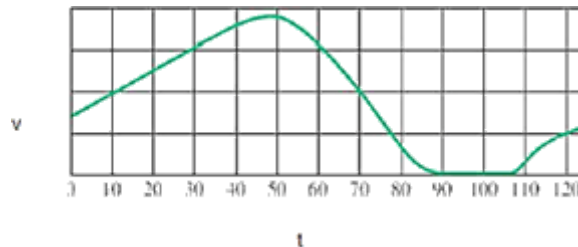

Since acceleration due to gravity acts during the motion, velocity of the body changes through-out the motion.

So KE and momentum changes

Now Acceleration due to gravity acts in vertical direction, so vertical component of velocity changes

Since there is no horizontal acceleration, horizontal components remain constant

**Graphical question**
