5.1 Overview

5.1. 1 Continuity of a function at a point

Let f be a real function on a subset of the real numbers and let c be a point in the domain of f . Then f is continuous at c if

$$\lim_{x \rightarrow c} f(x) = f(c)$$

More elaborately, if the left hand limit, right hand limit and the value of the function at $x = c$ exist and are equal to each other, i.e.,

$$\lim_{x \rightarrow c^-} f(x) = f(c) = \lim_{x \rightarrow c^+} f(x)$$

Then f is said to be continuous at $x = c$.

5.1. 2 Continuity in an interval

(i) f is said to be continuous in an open interval (a, b) if it is continuous at every point in this interval.

(ii) f is said to be continuous in the closed interval $[a, b]$ if

- f is continuous in (a, b)
- $\lim_{x \rightarrow a^+} f(x) = f(a)$
- $\lim_{x \rightarrow b^-} f(x) = f(b)$

5.1. 3 Geometrical meaning of continuity

(i) Function f will be continuous at $x = c$ if there is no break in the graph of the function at the point $(c, f(c))$.

(ii) In an interval, function is said to be continuous if there is no break in the graph of the function in the entire interval.

5.1. 4 Discontinuity

The function f will be discontinuous at $x = a$ in any of the following cases:

- (i) $\lim_{x \rightarrow a^-} f(x)$ and $\lim_{x \rightarrow a^+} f(x)$ exist but are not equal.
- (ii) $\lim_{x \rightarrow a^-} f(x)$ and $\lim_{x \rightarrow a^+} f(x)$ exist and are equal but not equal to $f(a)$.

(iii) $f(a)$ is not defined.

5.1. 5 Continuity of some of the common functions

	Function $f(x)$	Interval in which , is continuous
1.	The constant function, i.e.. $f(x) = c$	\mathbb{R}
2.	The identity function, i.e.. $f(x) = x$	\mathbb{R}
3.	The polynomial function, i.e.. $f(x) = a_0x^n + a_1x^{n-1} + \dots + a_{n-1}x + a_n$	\mathbb{R}
4.	$ x - a $	$(-\infty, \infty)$
5.	x^n, n is a positive integer	$(-\infty, \infty) - \{0\}$
6.	$\frac{p(x)}{q(x)}$, where $p(x)$ and $q(x)$ are polynomials in	$\mathbb{R} - \{x : q(x) = 0\}$
7.	$\sin x, \cos x$	\mathbb{R}
8.	$\tan x, \sec x$	$\mathbb{R} - \left\{ (2n + 1) \frac{\pi}{2} : n \in \mathbb{Z} \right\}$
9.	$\cot x, \operatorname{cosec} x$	$\mathbb{R} - \{n\pi : n \in \mathbb{Z}\}$
10.	e^x	\mathbb{R}
11	$\log x$	$(0, \infty)$
12	The inverse trigonometric functions, <i>i.e.</i> , $\sin^{-1} x, \cos^{-1} x$ etc	In their respective domains

Continuity of Some of the Common Functions

5.1. 6 Continuity of composite functions

Let g and f be real valued functions such that $(f \circ g)$ is defined at a. If g is continuous at a and f is continuous at $g(a)$, then $(f \circ g)$ is continuous at a.

5.1. 7 Differentiability

The function defined by $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$, wherever the limit exists, is defined to be the derivative of f at x . In other words, we say that a function f is differentiable at a point c in its domain if both $\lim_{h \rightarrow 0^-} \frac{f(c+h) - f(c)}{h}$, called left hand derivative, denoted by $Lf'(c)$, and $\lim_{h \rightarrow 0^+} \frac{f(c+h) - f(c)}{h}$, called right hand derivative, denoted by $Rf'(c)$, are finite and equal.

(i) The function $y = f(x)$ is said to be differentiable in an open interval (a, b) if it is differentiable at every point of (a, b)

(ii) The function $y = f(x)$ is said to be differentiable in the closed interval $[a, b]$ if $Rf'(a)$ and $Lf'(b)$ exist and $f'(x)$ exists for every point of (a, b) .

(iii) Every differentiable function is continuous, but the converse is not true

5.1. 8 Algebra of derivatives

If u, v are functions of x , then

$$(i) \frac{d(u \pm v)}{dx} = \frac{du}{dx} \pm \frac{dv}{dx}$$

$$(ii) \frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$$

$$(iii) \frac{d}{dx} \left(\frac{u}{v} \right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}$$

5.1. 9 Chain rule is a rule to differentiate composition of functions. Let $f = v \circ u$. If

$$u = u(x) \text{ and both } \frac{du}{dx} \text{ and } \frac{dv}{dt} \text{ exist then } \frac{df}{dx} = \frac{dv}{dt} \cdot \frac{du}{dx}$$

5.1. 10 Following are some of the standard derivatives (in appropriate domains)

$$1. \frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}$$

$$2. \frac{d}{dx}(\cos^{-1} x) = \frac{-1}{\sqrt{1-x^2}}$$

$$3. \frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$$

$$4. \frac{d}{dx}(\cot^{-1} x) = \frac{-1}{1+x^2}$$

$$5. \frac{d}{dx}(\sin^{-1} x) = \frac{1}{|x| \sqrt{x^2-1}}, |x| > 1$$

$$6. \frac{d}{dx}(\cos^{-1} x) = \frac{-1}{|x| \sqrt{x^2-1}}, |x| > 1$$
